## 13 Programming/Monitoring V/C Analog Interface (Ureg /Ireg) (Umon/Imon)

The standard programming of these devices is an analog interface. The output voltage is linearly proportional to the adjusted analog control signal. If the control signal 0V and/or 0A applies the power supply delivers 0V at the output. The power supply is already working from 0V output voltage and low load with high precision. The monitor signal is analog linear to the output voltage. The monitor signal for current and voltage is the real value that is measured directly at the output of the power supply. If a sense line is connected to compensate for the voltage drop across the load lines, the monitor signal is exactly the value that is measured at the connection point of the sense line. The description of the power supply in the sense operation is carried out in a separate section. The analog inputs and outputs are non-floating. The mass is connected to the DC negative output. The adapter provides the ability to select the desired input / output via a DIP switch. The burden of the control voltages is  $1\text{M}\Omega$ . The burden of the current interface is  $500\Omega$ . The latency to full compensation of V/C on the interface from 0-100% is 15ms for all models. If the power supply is operated with a low load, the down-programming time up to the desired set point may be very long. The power supply has large built-in capacitors and an enormous energy reserve. A similar effect occurs by skidding input energy, which is not easily removed from the power supply.

## 14 Compensation of Load Line Drop Voltage (Sense +/-), standard operation mode

The power supply has a Sense Mode to compensate for the voltage drop over long load lines. The compensation amounts to a maximum of 2V per load line. Under certain circumstances, it can be expected to apply more complicated external interference suppression. If sense is not used, Sense + and Sense - shall necessarily be connected by short bridges to AUX + and AUX - (factory setup). Make sure that +/- connections are matching! WARNING! Reverse polarity of the sense lines can cause damages to the power supply unit.

Sense operation: Remove the bridges between Sense +, Sense -. Connect the sense lines directly to the load. Pay attention to the polarity of plus and minus of the load to prevent damage to the power supply. To avoid interference, twist the sense lines. To reduce inductive effects, we recommend that the load lines position is close to each other. To supply a pulsating load, the use of an electrolytic capacitor and a ceramic capacitor has proved. The internal Over Voltage Protection (OVP) of the power supply controls the DC power directly to the DC output terminals. In case of an error the OVP acts automatically (see OVP values corresponding table). The sense terminals are directly connected to the power outputs.

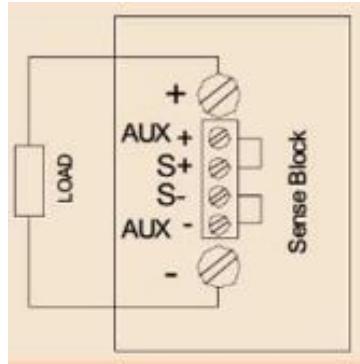

Figure 14.1: Local Sensing (factory setup)

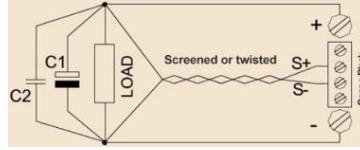

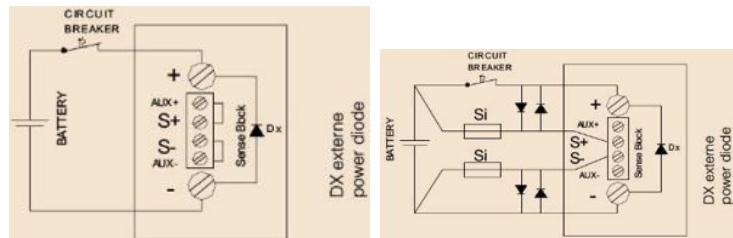

Figure 14.2: Remote Sensing (twisted sense lines)

## 15 Compensation Load Line Voltage Drop (Sense ++/--) battery charger operation mode

### Remote Sensing as a battery charger

If the power supply unit is used as a battery charger, it is recommended to refrain from sensing. It can lead to severe damage to the power supply, if the polarity of the sense line is confused (field experience: such error often occurs when system service is required, e.g., when the batteries are changed). If it is necessary to use sensing, proceed as described in the figure below. Proven approaches are 250mA for the fuses and 3...5A load capacity of diodes. WARNING! Reverse polarity of the sense lines can cause damages to the power supply unit.

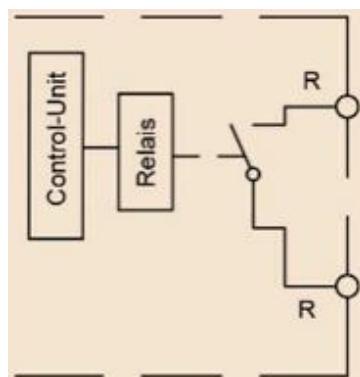

## 16 External Shutdown (SD)

The power supply is set to the Shutdown mode, when the control input is either shorted via a relay contact, a switch contact or an NPN transistor with open collector (voltage drop <1V, current typ. 2mA). If the shutdown repeats the power supply starts again. Using the soft-start, the current and the voltage rises within continuously to the default set values.

## 17 Power-OK Relay (DC Power Good)

The alarm signal DC OK has potential-free relay contacts. The contacts are closed (relay coil is energized) when the power output is active. In shut down mode (SD) the contacts are closed. The contacts are open when the power output is inhibited by OT or low AC supply voltage at the AC inputs. Contact load (resistive load): 30Vdc/1A, 60Vdc/0.3A, 30Vac/0.5A.

## 18 Over Voltage Protection (OVP)

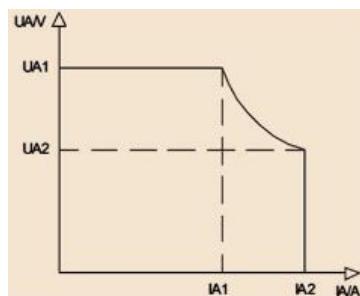

If an over-voltage occurs to the output (for example, defective components, external feed voltage), it is followed by the shutdown of the power output. A periodic restart attempts (ticker operation period 400ms).

## 19 Over Temperature Shutdown (OT)

The alarm LED OT lits when the temperature of the power supply is higher than the over-temperature protection threshold.

## 20 C/V Chart and Operating Point

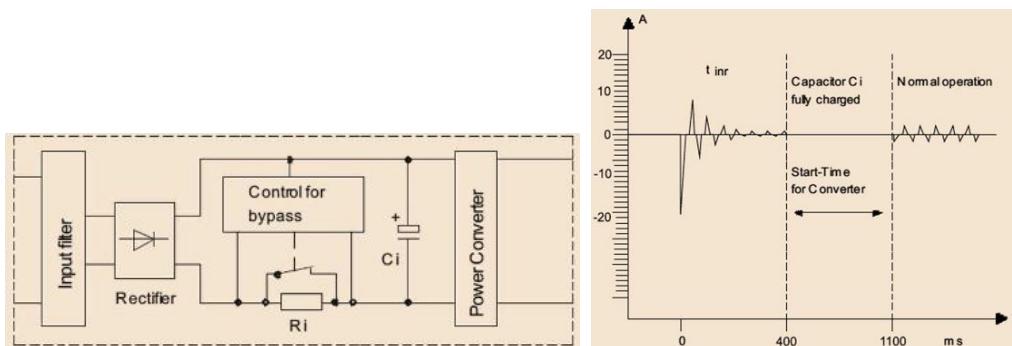

The output voltage set Vout is always linear proportional to the control signal Ureg. The desired control signal is selected via the DIP switcher: 0-5V, 0-10V, 0-20mA oder 4-20mA.

Model	UA1 (V)	IA1 (A)	UA2 (V)	IA2 (A)	Pmax (IA1/IA2)
D-IPS501C-24	30 VDC	16,0 A	20 VDC	24,0 A	480/480 W
D-IPS1001C-24	30 VDC	33,3 A	24 VDC	42,0 A	999/1008 W

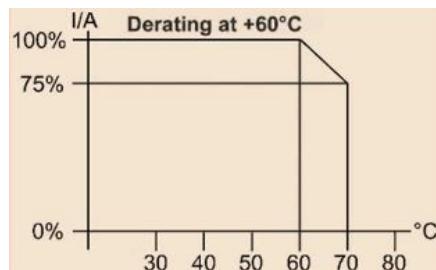

## 21 Inrush Current Protection (electronic)

The power supply unit has an electronic current limiter (230Vac=9,8Arms/13,8Apeak). It is a precisely working circuit instead of a usual simple NTC solution. The accuracy is  $\pm 10\%$ , regardless of the operating temperature and the duty cycles (interval  $\geq 10\text{s}$ ). We recommend the smallest circuit breaker a characteristic B with 16A (@D-IPS501C-24) respectively 32A (@D-IPS1001C-24) for 115Vac and with 16A for 230Vac.

## 22 Temperature Derating

The maximum ambient temperature during operation is  $+70^\circ\text{C}$ . If the overtemperature protection is activated, the power supply is switched off. The measuring point is 50mm outside the power supply. The power supply unit starts automatically when it has cooled down.

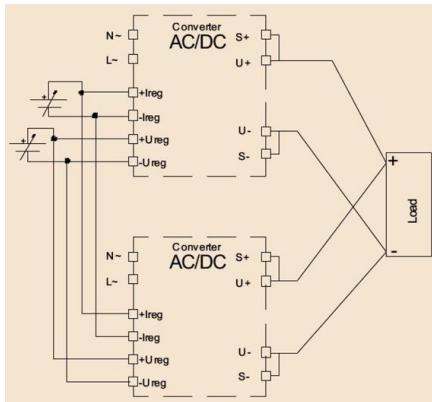

## 23 Series Operation

Two or more units of the same model and output voltage can be operated up to a total voltage of 60V in series. If the units are remotely controlled via the analog interface it is compulsory to use a potential-free control voltage!

## 24 Parallel Operation & N+1 Decoupling

To increase the overall power of the power supply, two or more devices of the same model with the same output voltage may be operated in parallel. We recommend using a busbar for the DC power connector. Make sure that the cable lengths and cable cross-sections of all power supplies to the busbar or to the star point are identical. Allow proper connection for low contact resistance. If you want to use the sensing function, connect it also to the star point or busbar. To avoid measurement errors, select the line length from the neutral point or from the busbar to the load as short as possible and use the maximum possible conductor cross-section. Up to 5 pcs D-IPS can be paralleled. The D-IPS models have no internal O-ring diode, to operate the devices redundant N+1.

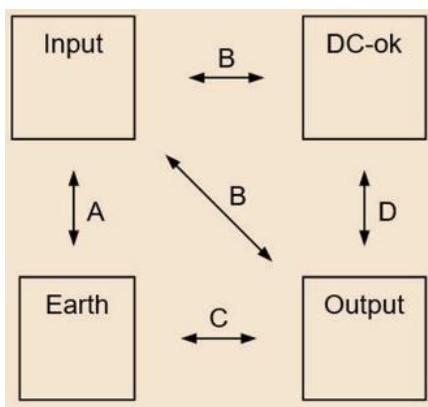

## 25 Electrical Safety (Factory-Test / Field-Test Owner)

	T	A	B	C*	D
Type Test	60 s	2500 VAC	3000 VAC	500 VDC	500 VDC
Factory Test	5 s	2000 VAC	2000 VAC	500 VDC	500 VDC
Field Test	2 s	2000 VAC	2000 VAC	500 VDC	500 VDC
Cut-off current setting		> 20 mA	> 20 mA	> 1 mA	> 1 mA

Type and factory test are the manufacturer. While repeating damage can happen to the power supply unit. For the field test (owner) follow the below instruction:

- a) Use suitable test equipment, raising the voltage slowly
- b) Short circuit L1 and N, and all the DC output terminals.
- c) Use only test voltages of 50/60Hz. The outputs are unearthed and therefore they have no resistance to GND/PE.

## 26 Temperature Management

The temperature management of the D-IPS series provides a direct dissipation of the main energy losses. The internal coolers of the output diodes and the power FETs connect to the back-plate cooler.

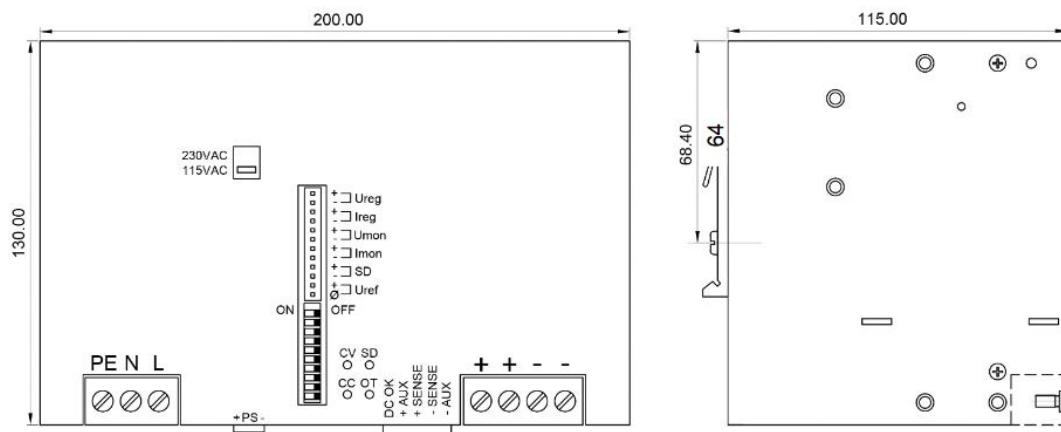

Figure 26.1: D-IPS501C-24

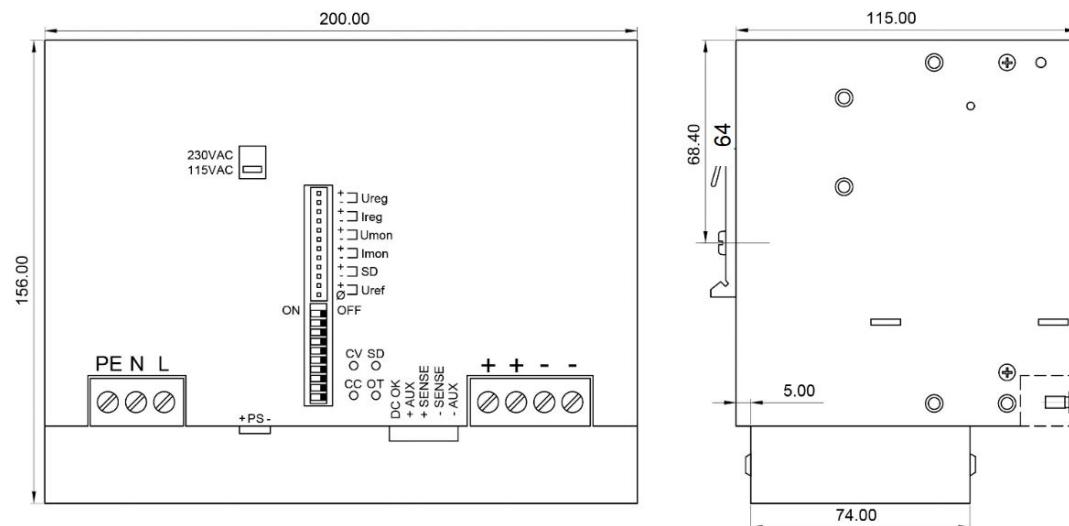

Figure 26.2: D-IPS1001C-24

I Products are described by information contained in catalogs and data-sheets. It is not be considered as assured qualities. Stresses listed under „Maximum Rating“(one at a time) may be applied to devices without resulting in permanent damage. The operation of the equipment for extended periods may affect device reliability. Limiting value tolerance are subject to usual fluctuation margins.

## 27 Mechanics & Installation Instruction of the device

Stable metal/aluminium housing IP20. To allow adequate convection, a free air space of 50mm (top/bottom) and 10mm (sidewalls) is required; and for active devices 15mm space from the sidewalls. For proper air convection it is necessary to install the D-IPS. One can use the DIN-Rail installation (equipped standard) with 35mm DIN-Rail bracket according to EN60715. It is easy to mount/dismount while snapping it onto the 35mm DIN-Rail - no tools necessary. It is not allowed to install the D-IPS in other mounting direction than as shown in the drawings.

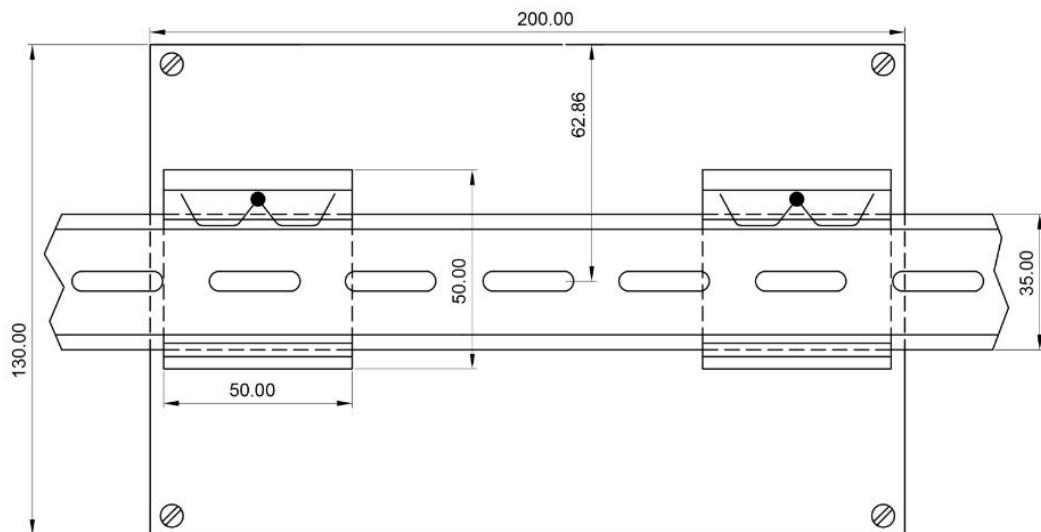

Figure 27.1: D-IPS501C-24

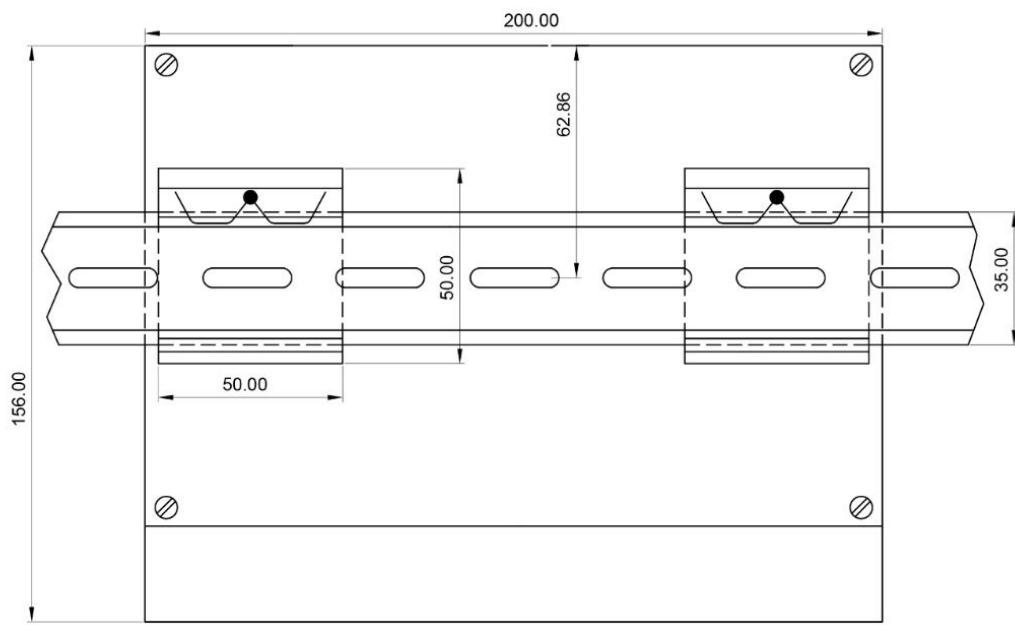

Figure 27.2: D-IPS1001C-24

## 28 Connections

### Clamp Connector Specifications

	<b>Input / Output connections</b>	<b>Signal connections plugs</b>

## 29 Safety regulations

**Please read these instructions completely before using the equipment. Keep these instructions on to hand. The device may only be operated by trained specialist staff.**

Installation:

- 1.) The device is designed for devices and systems that meet the standard requirements for hazardous voltages, power, and fire prevention.
- 2.) Installation and service only by trained specialists. The AC power must be switched off. The work is to be labelled; accidental reconnection of the system must be prevented.
- 3.) Opening the device, its modification, loosening bolts, or operation outside the specified herein specification or in an unsuitable environment, has the immediate loss of warranty to follow. We disclaim any responsibility for any resulting damage to persons or things.
- 4.) Note: The device must not be operated without an upstream circuit breaker (CB). We recommend the use of B-Type 16A for 230Vac and 16A (@D-IPS501C-24) respectively 32A (@D-IPS1001C-24) for 115Vac. It is prohibited to use the unit without PE. It may be necessary upstream device has a power switch.

Warning:

Non-compliance these warnings can result in fire and serious injury or death.

1. Never operate device without PE connection.
2. Before connecting the device to the AC network, make wires free of voltage and ensure that it cannot accidentally switch on.
3. Allow neat and professional cabling.
4. Never open nor try to repair the unit. Inside are dangerous voltages that can cause electrical shock hazard.
5. Avoid metal pieces or other conductive material to fall into the item
